Virtual Dry Fog
Finest Mist Available
Multiple Control Options

Main advantages

- ▶ Tiny droplets create a nearly dry mist
- ▶ Self-cleaning and low maintenance
- ▶ Easy to operate simple controls with multiple options
- ▶ Easily modified and extended

ProSonic Air

An ultrasonic air atomising nozzle system for odour and dust control. Ideal for use in areas which require an ultra-fine almost dry mist with an exceptionally small droplet size. Liquid is injected into an internal nozzle where it is mixed with a high speed air stream to break up the liquid. An external filament then vibrates at high frequencies to further break up the liquid creating tiny droplets.

The ultra-light mist will remain suspended in the atmosphere for an extended period of time ensuring maximum performance.

Main controls allow the adjustment of water and air pressures to main/individual/zones offering various inputs with both manual and automated controls available. For best results, use in conjunction with AiroPure®.
